

Parent/ Child Orders

Parent/ Child orders exist when the original order has recurring orders attached.

For example:

The parent order of a timed study would be 'cbc w/auto diff daily-now for three times'.

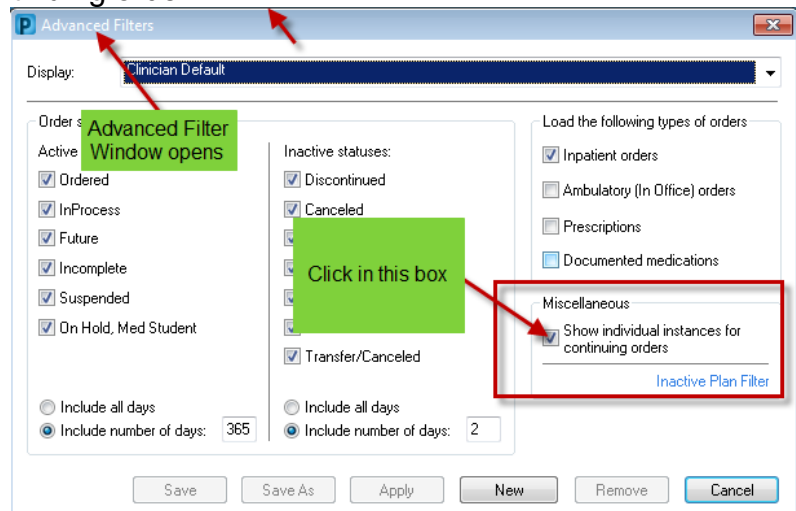

The children of this order would be the individual cbc orders for the three times

To view the child orders, a advanced filter needs to be set:

1. Click on the elipsis button beside the display window

2. The Advance Filter window opens. Click on the box –Show individual instances for continuing order.

3. Click Apply.

On the orders page Parent /Child order will display with the black delta symbol ▶

When you click on the black delta the parent order will expand to display the child orders.

Individual "Child" Orders

The 'Show individual instances of continuing orders setting' enables the display of the 'parent' or initial order with a list of subsequent 'child' orders listed below for the next 12 hours..
