

## Blood Bank Orders

When ordering blood products, **do not** use a “Single” order

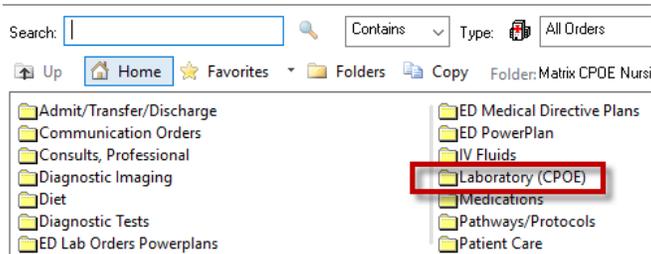

Use the appropriate PowerPlan

Blood Bank Power Plans are:

- Based on Best Practice
- Allow for multiple orders to be placed at the same time
- Have items preselected
- Pre-selected options may be removed if not required
- Additional orders may be entered if required

### To place the order(s):

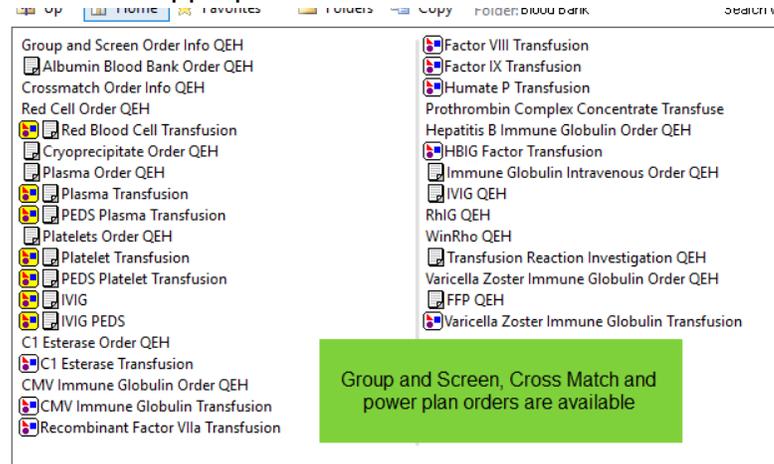

- Open the “**Laboratory (CPOE)**” folder

- Open “**Blood Bank**” sub folder

- Select the appropriate order

- Pre-selected options can be removed by un-checking the box
- Additional orders may be added by using the **“Add to Phase”** button

The screenshot displays a medical order entry system. On the left, a list of orders is shown, including 'Red Blood Cell Transfusion (Initiated Pending)' and 'Transfusion Reaction Treatment (Initiated Pending)'. The main panel on the right shows the details of the 'Red Blood Cell Transfusion' order. At the top, there are controls for 'Add to Phase', 'Check Alerts', 'Start' (set to 'Now'), and 'Duration' (set to 'None'). Below this is a table with columns for 'Component', 'Status', and 'Details'. The table lists several components:
 

- 'Vital Signs' with a status of 'Initiated' and details 'Within 1 hour prior to starting transfusion'.
- 'Patient Care' section containing two 'Freetext Order to Nurse' entries. The first is unchecked, and the second is checked with a red arrow pointing to it. The details for the checked entry are 'Discontinue Red Blood Cell administration of...'
- 'Transfusion Reaction Treatment' with a status of 'Initiated Pending'.
- 'Laboratory' section containing 'Please complete Transfuse details.' and 'Red Blood Cells Transfuse' with a status of 'Select an order'.

- Review the details
- Sign order
