Health PEI

Spaulding's Classification

Spaulding's Classification is a system used in healthcare to determine the level of cleaning, disinfection, or sterilization required for medical equipment/devices based on the risk of infection they pose. It categorizes instruments into **three** groups:

Critical: Instruments that enter sterile tissue or the bloodstream (e.g., surgical tools) — Require sterilization.

 Semi-Critical: Devices that contact mucous membranes or non-intact skin (e.g., endoscopes) — Require high-level disinfection.

KNOW

Non-Critical: Items that touch intact skin only (e.g., blood pressure cuffs) — Require low or intermediate-level disinfection.

This classification helps ensure proper reprocessing of medical equipment/devices to prevent infections and promote patient safety!
