Framingham Reference Guide

You can access an automatically calculated Framingham score using Patient Embedded View.

Instructions on how to access the Patient Embedded View are found here:

https://help.inputhealth.com/en/articles/3496589-patient-embedded-view

The Framingham calculates based on several data points located in the patient chart:

Age: Calculated from Date of Birth

Sex: Pulled from Sex field, which represents Sex at Birth

HDL-C and **Total Cholesterol**: Pulled from Lab Results. The ordering practitioner or primary practitioner must have e-results turned on for this field to populate. Will pull the most recent result.

Systolic Blood Pressure: Pulls from the latest vitals.

Hypertension Treated: A medication that treats hypertension must be listed under the patient's medication section of the chart for the patient to be considered treated.

Smoker: To be set to Yes, the patient must have one of two fields populated:

1- Social History Record under Health Profile
   Type: Substance Use
   Sub-type: Smoking
   Status: Current Smoker (daily), Occasional (non daily), Smoker, or Current Smoker with attempts to Quit
2- Social History under Patient Data (which can be added to the chart header)
   Status: Current every day smoker, current someday smoke, or Smoker.

Diabetic: Patient must have a diagnosis listed under their Health Profile that starts with 250.**

To find a list of potential diabetics that do not have a 250.** code listed on their chart, please visit the Diabetes (Primary Care) dashboard located under your analytics icon.
